

FRIDAY, MAY 18, 2018

8:00 am – 9:30 am	REGISTRATION AND CONTINENTAL BREAKFAST
8:15 am – 9:00 am	EXPERIENTIAL OPPORTUNITIES Yamuna Foot Walkers and Yoga <i>Laura Flanagan</i> <i>Feynman Winter Garden</i> The Shape (Shifting) of Consciousness: A Sonic Odyssey <i>Lisa O'Connor</i> <i>BioPharmaceutical Technology Center Auditorium</i>
9:30 am – 9:45 am	Day Two Overview <i>William Linton</i>
9:45 am – 10:45 am	Who's Really in Control? Quantifying the Influence of the Unconscious Brain <i>Heather Berlin</i>
10:45 am – 11:00 am	BREAK
11:00 am – 12:00 pm	Hidden Cognition in the Severely Injured Brain: How to Identify It and Where Do We Go from There? <i>Nicholas Schiff</i>
12:00 pm – 1:00 pm	LUNCH
1:00 pm – 2:00 pm	Challenges and Opportunities for Consciousness Research: Perspectives from Buddhist Thought and Meditative Practice <i>Thupten Jinpa</i>
2:00 pm – 2:15 pm	BREAK
2:15 pm – 3:15 pm	PANEL DISCUSSION: Heather Berlin, Thupten Jinpa and Nicholas Schiff <i>Steve Paulson, Moderator</i>
3:15 pm – 3:45 pm	CLOSING REMARKS AND MEDITATION
3:45 pm – 4:30 pm	DESSERT RECEPTION

PLATINUM SPONSORS

BioPharmaceutical Technology Center Institute
Michael Best & Friedrich LLP
Perkins Coie LLP
Promega Corporation
Usona Institute
von Briesen & Roper, LLC

GOLD SPONSOR

Heffter Research Institute

SILVER SPONSORS

California Institute of Integral Studies
City of Fitchburg
Bruce & Darby Fetzer
Fitchburg Chamber Visitor & Business Bureau
Madison College
Master of Science in Biotechnology Program,
University of Wisconsin-Madison

BRONZE SPONSORS

Karen & Craig Christianson
Bill Christofferson & Karin Borgh
Gateway Technical College
School of Human Ecology,
University of Wisconsin-Madison

CONTRIBUTORS

Center for Investigating Healthy Minds,
University of Wisconsin-Madison
Kickapoo Coffee Roasters
Neuroscience Training Program,
University of Wisconsin-Madison

Means and Metrics

for Detecting and Measuring Consciousness

International Forum on Consciousness

May 17–18, 2018

BioPharmaceutical Technology Center, Madison, WI

SCHEDULE

THURSDAY, MAY 17, 2018

7:30 am – 8:30 am	REGISTRATION AND CONTINENTAL BREAKFAST
8:30 am – 8:45 am	Welcome and Forum Introduction <i>William Linton</i>
8:45 am – 9:45 am	Consciousness and Its Place in Nature <i>Christof Koch</i>
9:45 am – 10:15 am	Conversation with Christof Koch and Thupten Jinpa <i>Steve Paulson, Moderator</i>
10:15 am – 10:45 am	BREAK
10:45 am – 11:45 am	Quantifying Consciousness from First Principles: Integrated Information Theory <i>Melanie Boly</i>
11:45 am – 12:00 pm	Review Movement/Experiential Opportunities <i>Lisa O'Connor and Laura Flanagan</i>
12:00 pm – 1:45 pm	LUNCH 30-minute Movement Sessions at Feynman Winter Garden
12:15 pm – 12:45 pm	<i>Qigong with Lisa O'Connor</i>
1:00 pm – 1:30 pm	<i>Gentle Yoga with Laura Flanagan</i>
1:45 pm – 2:45 pm	Within and Without Self: Teachings from Psychedelics <i>Franz Vollenweider</i>
2:45 pm – 3:00 pm	BREAK
3:00 pm – 4:00 pm	PANEL DISCUSSION: Melanie Boly, Christof Koch and Franz Vollenweider <i>Steve Paulson, Moderator</i>
4:00 pm – 4:30 pm	Sound Meditation <i>Lisa O'Connor</i>
4:30 pm – 5:45 pm	RECEPTION
6:00 pm – 8:00 pm	HOSTED DINNER CONVERSATIONS Feynman Winter Garden (pre-registration required)

MEANS AND METRICS FOR DETECTING AND MEASURING CONSCIOUSNESS

As we continue to examine the facets of consciousness, this year we explore the newest emerging technologies for studying the phenomenon of consciousness, including research related to sleep, wakefulness, altered states, focused attention and coma. How might our ability to better measure consciousness create opportunities to improve human function, resolve disease states and keep the brain and mind healthier throughout all stages of life?

COORDINATED BY:

BioPharmaceutical Technology Center Institute and Promega Corporation

PRESENTERS

Heather Berlin, Ph.D., MPH, Assistant Professor, Department of Psychiatry, Icahn School of Medicine at Mount Sinai; Weill Cornell Medicine/NY Presbyterian Hospital, Department of Neurological Surgery, Sackler Brain and Spine Institute, New York, NY

Melanie Boly, M.D., Ph.D., Clinical Neurophysiology Fellow, Department of Neurology, University of Wisconsin-Madison, Madison, WI

Thupten Jinpa, Ph.D., President, Institute of Tibetan Classics; Adjunct Professor, Tibetan Buddhist Philosophy, McGill School of Religious Studies, Montreal, Quebec; Principal English Translator for His Holiness the Dalai Lama

Christof Koch, Ph.D., Chief Scientist and President, Allen Institute for Brain Science, Seattle, WA

Nicholas D. Schiff, M.D., The Jerold B. Katz Professor of Neurology and Neuroscience in the Feil Family Brain and Mind Research Institute and Professor of Neuroscience, Neurology, and Public Health, Weill Cornell Medical College; Co-Director, CASBI, the Consortium for the Advanced Study of Brain Injury, Cornell University, Ithaca, NY

Franz Vollenweider, M.D., FMH Psych., Co-Director for Psychiatric Research, Department of Psychiatry, Psychotherapy and Psychosomatics; Director, Neuropsychopharmacology and Brain Imaging and Heffter Research Center, University of Zürich, Zürich, Switzerland

MODERATORS

William Linton, President & CEO, Promega Corporation, Madison, WI (Welcome and Closing Remarks)

Penny Patterson, Senior Director, Communications and Marketing Services, Promega Corporation, Madison, WI (Presentations Moderator)

Steve Paulson, Executive Producer, *To The Best Of Our Knowledge*, Wisconsin Public Radio and Public Radio International, Madison, WI (Panel Moderator)

MUSICIANS AND IMMERSION ARTISTS

Tony Castañeda Latin Jazz Band

Tani Diakite

Laura Flanagan

Lisa O'Connor

Stephanie Steigerwaldt

Djam Vivie

ABSTRACTS

Who's Really in Control? Quantifying the Influence of the Unconscious Brain

Heather Berlin

Do you really have control over your decisions and behaviors? And if so, which parts of your brain constitutes the "you" and which parts submit themselves to "your" will? According to recent findings, complex cognitive and emotional processing at the unconscious level significantly affects how humans behave, think and feel. Scientists are now beginning to understand how this occurs at the neural level. Research taking advantage of advances in neuroimaging has led to a revival and re-conceptualization of some of the key concepts of psychoanalytic theory. And investigating what an artist's brain looks like during an improvised performance (i.e., spontaneous creativity) is giving us unique insights into the neural basis of unconscious processes. Understanding these mechanisms also lets us influence the brain in more direct ways. Finally, I will discuss what is currently achievable with brain/computer interfaces and the ways we are learning to change ourselves with the push of a button via neural prosthetics, causing us to ponder, "Who's really in control anyway?"

Quantifying Consciousness from First Principles: Integrated Information Theory

Melanie Boly

Behavioral reports have traditionally been the gold standard for evaluating the presence of consciousness. However, it is becoming clear that consciousness can be present even in the absence of overt behavior and in unresponsive subjects. I will present neurophysiological evidence supporting the presence of consciousness in dissociated states from several domains. Measures of cortical integration and differentiation have recently proven to be the most reliable marker of consciousness irrespective of behavior and have been validated in a large number of different conditions. The most common dissociation between consciousness and behavior occurs every night during dreaming sleep. Recent work using both within-state, no-task paradigms and TMS-EEG shows that consciousness can be present during non-REM sleep when the front of the brain shows high amplitude slow waves, as long as a posterior cortical hot zone is activated. Studies using different anesthetics have also shown that fully unresponsive subjects anesthetized with ketamine (as compared to propofol or xenon) retrospectively report intense dreams, which are again associated with high-complexity responses to TMS, despite the occurrence of slow waves. High-complexity responses can also be observed in about 20% of patients in a vegetative state, suggesting that which is in line with previous findings using active paradigms: that a number of completely unresponsive patients may retain consciousness. Finally, a number of studies in healthy awake volunteers have emphasized frequent dissociations between consciousness and task-related cognitive functions. Overall, recent findings show that the anatomical neural correlates of consciousness are primarily localized to a posterior cortical hot zone that includes sensory areas rather than to a fronto-parietal network involved in task monitoring and reporting. I will end by discussing promising theoretical approaches and avenues of future research.

Challenges and Opportunities for Consciousness Research: Perspectives from Buddhist Thought and Meditative Practice

Thupten Jinpa

With increasing sophistication in brain imaging techniques and growing refinement in measurements of specific facets of consciousness—perception, attention, meta-awareness, memory, etc.—today neuroscience represents an important discipline

within the scientific study of consciousness. An exciting part of this new science of consciousness is the willingness to look at the interaction between the mind and the brain, exploring the question of how conscious mental processes, such as disciplined meditative practice, might affect the brain in measurable ways. Studies of long-term Buddhist meditators hold the promise of expanding our current understanding of the human mind's capacities and open new ways to understand the mechanisms of mind-to-brain effects. My presentation will focus on two questions: 1) What specific contemplative practices from the Buddhist tradition can offer opportunities for exploring the difficult question of mind-to-body effects? (I will provide few examples of such practices); and 2) What might we learn from Buddhist theorizing on consciousness with respect to identifying what could be called the core features of consciousness? Other questions I shall raise include "Does the pan-Indian concept of 'mental consciousness' (manas) suggest a crucial gap in contemporary Western conceptualization on consciousness?", "What does the Buddhist equation of mind (citta) as a repository of dispositions, mental faculty (manas) as the organ of cognition, and consciousness (vijnana) as the instrument of cognition suggest about the essential character of consciousness?", "What questions does the Buddhist notion of concept-free consciousness and meditative state of content-free pure consciousness pose to the contemporary concept of consciousness?" These questions will be raised to enrich our growing cross-cultural dialogue on the difficult problem of consciousness.

Consciousness and Its Place in Nature

Christof Koch

Human and non-human animals not only act in the world but are capable of conscious experience. That is, it feels like something to have a brain and be cold, angry or see red. I will discuss the empirical progress that has been achieved over the past several decades in locating the footprints of consciousness to the posterior part of cortex in the back of the brain.

I will introduce Integrated Information Theory (IIT). IIT explains in a principled manner which physical systems are capable of conscious, subjective experience. The theory explains many biological and medical facts about consciousness and has been used to build a consciousness meter to assess the presence of consciousness in neurological patients. IIT also predicts that consciousness is much more widespread in biology than conventionally assumed, that a silent cortex may give rise to experience and that digital computers cannot be conscious, even if they were to perfectly simulate a human brain. Consciousness does not arise as a form of computation but as a causal power.

Hidden Cognition in the Severely Injured Brain: How to Identify It and Where Do We Go from There?

Nicholas Schiff

Severely brain-injured patients who harbor high-level cognitive function and are misidentified as unconscious or minimally conscious represent a vastly underserved population that is uniquely vulnerable to neglect and lack of therapeutic engagement. This lecture will review a wide range of studies aimed at identifying such hidden cognitive capacity and consider the possible underlying mechanisms producing cognitive motor dissociation (CMD). CMD patients have sustained both marked injury to the motor systems as well as injuries within the corticothalamic pathways but can nonetheless demonstrate at least evidence for command following capacities on functional magnetic resonance imaging (fMRI) or electroencephalography (EEG). In ongoing research we have identified and tracked spontaneous recovery of communication capacity in some CMD patients. In this lecture we will give special consideration to the unique challenges that brain injuries producing CMD bring to

reestablishing communication systems. Evidence will be presented supporting the view that many CMD patients can be expected to harbor the capacity to recover and establish reliable communication with the surrounding world. That such transformative outcomes may be possible should motivate a broad rethinking of our overall approach to the severely brain-injured patient.

Within and Without Self: Teachings from Psychedelics

Franz Vollenweider

Recent years have seen a burgeoning scientific interest in the phenomenology and underlying neurobiology of altered states of consciousness (ASC) induced by psychedelic drugs such as psilocybin and LSD, also driven by growing evidence of their beneficial effects on physical and mental well-being. At the core of the psychedelic experience is the dissolution of the phenomenological self or ego concomitant with a feeling of oneness or unity with all that exists and a sense that one's everyday identity has dissolved into a timeless ultimate reality. This peculiar state of selflessness arises sequentially and unfolds along with profound changes in perception and mood to culminate in a blissful state of content-free pure consciousness, also referred to as peak or mystical-type experience according to the literature on the philosophy of spirituality. In this presentation I will discuss recent research strategies with psychedelics and advances to identify molecular, cellular and system-based correlates of psychedelic-induced alterations of the sense of self, emotion processing, imagery and social interactions. Furthermore, I will discuss some recent advances in the clinical applications of psychedelic drugs in psychiatric disorders such as depression.

FRIDAY MORNING EXPERIENTIAL OPPORTUNITIES

Yamuna Foot Wakers and Yoga

Laura Flanagan

Learn how important the feet are as your foundation. Massage and train your feet on unique tools called Yamuna Foot Wakers. These little half-magical spheres not only massage reflexology points in the feet but also strengthen the over 100 muscles in the feet, helping to take you out of patterns that extend into the knees, hips, spine and shoulders. Participants will also learn and experience ways to immediately release and keep tension out of the body through simple yoga exercises that can be done at work, standing in line at the grocery store or even sitting at a stoplight in traffic.

The Shape (Shifting) of Consciousness: A Sonic Odyssey

Lisa O'Connor

Engage in conversation with presence through malleable wave patterns and geometric frequencies that will expand the shape of your awareness, in dimensions, at first more felt than heard. Intervals of song and sound will excite conscious coherence in your memory, meditation, being and becoming. Through the use of voice, high-resonance sounding tools and a kaleidoscope of global instrumentation, Lisa creates sonic spaces wherein listeners can come to meet all of who they are, let go of inhibitions and yield to basic trust and inspiration, so their full potential can be realized and embodied for the way forward.
